

Got a light?

This guy was working in aircraft maintenance with a friend when he had a classic moment. A classic cartoon moment, that is. The two men were working on an airstrip using a portable power unit that ran on liquid fuel. Before the job was done, the power unit died. It is common practice on many such machines to check the actual level of fuel in the tank, as opposed to the level visible on the gauge mounted outside. But they couldn't see in, because it was too dark. So this man asked the other for his lighter. His co-worker cautioned him that mixing fuel and lighters was a bad idea.
